

ScanCom's new Duracint® factory in HCMC

ScanCom press release November 2007

ScanCom's management team made the decision to build up the factory to set new steel & mesh standards of quality and functionality combined products with an acceptable selling price. This has become a reality! The project manager Mr. Pham Hoang The Nguyen and his team are working very hard to pursue the time schedule so the first products can roll out by the end of October.

The production with state-of-the-art industrial technology will start in the beginning of November 2007. The new technology is an automatic system with advantages of having 4 times higher speed, advanced quality, lower costs and being environment-friendly.

The factory can coat around 140,000 chairs per month that means 4.4 chairs per minute. The steel and mesh products always feel pleasantly warm, smooth and silky, for the reason that the surface is hot-melt powder coated with Duracint®. The new Duracint® coating is more resilient than conventional powder coatings and offers perfect protection against corrosion and damage.

Duracint® products are perfect for outdoor use:

- weather resistant
- corrosion resistant
- UV-resistant
- maintenance free.
